Industrial glass, also called architectural glass, solid material that is normally lustrous and transparent in appearance and that shows great durability under exposure to the natural elements. These three properties—lustre, transparency, and durability—make glass a favoured material for such household objects as windowpanes, bottles, and lightbulbs.

Goldschmidt, who is considered the founder of modern crystal chemistry, was in a position to derive empirical rules for glass formation from his studies. Ionic size relationships played a decisive role in Goldschmidt's glass model in a fashion similar to his crystal structure model, and he postulated a ratio of 0.2-0.4 for the radius-of-cation ( $r_c$ ) to radius-of-anion ( $r_a$ ) ratio as a ...

The interdisciplinary field of materials science, also commonly termed materials science and engineering is the design and discovery of new materials, particularly solids. The intellectual origins of materials science stem from the Enlightenment, when researchers began to use analytical thinking from chemistry, physics, and engineering to understand ancient, phenomenological observations in ...

Self-assembled monolayers (SAM) of organic molecules are molecular assemblies formed spontaneously on surfaces by adsorption and are organized into more or less large ordered domains. In some cases molecules that form the monolayer do not interact strongly with the substrate. This is the case for instance of the two-dimensional supramolecular networks of e.g. perylenetetracarboxylic ...

Choosing a temperature sensor is not easy: Thermistor, RTD or thermocouple? But measuring temperatures inside a furnace can present several challenges: high temperatures, temperature cycling, and hostile atmospheres exceeding the limits of many measurement devices while others have greatly reduced lifetimes and poor accuracy.
